1. **How to use**

   (1) Wash dentures clean with a toothbrush and dry them well. (Cushion Correct EZ poorly adheres to wet dentures.)
   (2) Squeeze just enough adhesive paste from a product tube by use of an accompanying roll-up tool, and cut off the adhesive paste as shown in Figure 1. (Standard amount of the adhesive paste for one-time use is roughly equal to a 1-cm diameter ball for each of the upper and lower arches of complete dentures. However, it is necessary to find out an adequate amount individually from personal experiences because an application amount depends on the size of dentures and on the volume of spaces between dentures and gums. Especially, in case of partial dentures which vary in size and shape, adjust an application amount for individual dentures.)
   (3) Apply adhesive paste mainly to sites of dentures contacted directly with gums, and coat thickly sulcus of dentures with adhesive paste. (See Figures 2-1, 2-2, 2-3, and 2-4)
   (4) After application, pour water on dentures to decrease stimulation of alcohol as shown in Figure 3.
   (5) Wear dentures and bite down 2 to 3 times. (See Figure 4)
   (6) If you mind adhesive paste overflowed from dentures, cut it off at the edge of dentures as shown in Figure 5. And then press the remaining part well to make it smooth.

---

**Specifications**

Adhesion strength: Not less than 5 kPa, pH4-pH10

**Characteristics**

Cushion Correct EZ is an easy-to-use denture adhesive with a high adsorptive performance and a sufficient elasticity to chew food well. Denture adhesives reduce temporarily the discomforts associated with spaces between dentures and gums or loosening of dentures. There are two types of denture adhesives.

1. **Cushion type**
   - Denture adhesive paste is filled in the spaces between dentures and gums, and makes the dentures stick stably to gums. Ingredients are not dissolved by saliva etc. and the adhesive paste becomes gradually hard and remains on the dentures.

2. **Glue type**
   - Denture adhesive glue increases adhesive performance with liquid and saliva in the mouth, and makes the dentures adhere stably to gums. Ingredients are dissolved by saliva etc. and the denture adhesive glue gradually disappears.

Cushion Correct EZ is a cushion type denture adhesive. This product is recommended to persons who cannot chew food well due to pain, when some food is stuck between dentures and gums or when poor-fitting dentures get in contact with gums.

**Form, design, principle etc.**

**Ingredients**

- Polyvinyl acetate resin, dehydrated ethanol, Red No.102 (contains alcohol)
- A major ingredient of Cushion Correct EZ, polyvinyl acetate resin which is also used in chewing gum, is not dissolved by saliva etc., hardens gradually and remains on dentures.

**Form**

- Pale red paste

**Principle**

Cushion Correct EZ makes dentures stick to oral mucosa by adsorbability (negative pressure).

**Intended use**

Denture stability (Cushion Correct EZ stabilizes dentures by filling spaces between dentures and gums.)

**How to use**

1. **How to use**
   (1) Wash dentures clean with a toothbrush and dry them well. (Cushion Correct EZ poorly adheres to wet dentures.)
   (2) Squeeze just enough adhesive paste from a product tube by use of an accompanying roll-up tool, and cut off the adhesive paste as shown in Figure 1. (Standard amount of the adhesive paste for one-time use is roughly equal to a 1-cm diameter ball for each of the upper and lower arches of complete dentures. However, it is necessary to find out an adequate amount individually from personal experiences because an application amount depends on the size of dentures and on the volume of spaces between dentures and gums. Especially, in case of partial dentures which vary in size and shape, adjust an application amount for individual dentures.)
   (3) Apply adhesive paste mainly to sites of dentures contacted directly with gums, and coat thickly sulcus of dentures with adhesive paste. (See Figures 2-1, 2-2, 2-3, and 2-4)
   (4) After application, pour water on dentures to decrease stimulation of alcohol as shown in Figure 3.
   (5) Wear dentures and bite down 2 to 3 times. (See Figure 4)
   (6) If you mind adhesive paste overflowed from dentures, cut it off at the edge of dentures as shown in Figure 5. And then press the remaining part well to make it smooth.
2. Material and type of dentures
(1) Cushion Correct EZ is available for plastic base but not for metal base.
(2) Cushion Correct EZ is available mainly for complete and partial dentures but not for a bridge, a prosthetic tooth and some partial dentures.

Precautions for use of Cushion Correct EZ
1. Wait at least 1 or 2 hours to eat hard foods and have a hot drink after insertion of dentures, even though Cushion Correct EZ is adaptable generally to eat and drink soon after insertion.
2. Do not use this product continuously for 6 days or more without renewed application. (Prolonged use without renewed application leads to poor dental health such as bacterial growth and causes difficulty in removing adhesive residue from dentures.)
3. Be aware of the followings during or after use.
   (1) If you feel stimulation in the mouth after insertion of dentures, rinse them lightly with water and then reinsert them. If there is still stimulation strongly after rinsing with water, stop using the product.
   (2) Remove dentures with Cushion Correct EZ at bedtime.
   (3) Do not use Cushion Correct EZ for a bridge, a prosthetic tooth and some partial dentures.
   (4) Close the cap of a product tube tightly after use. (If the cap is closed loosely, adhesive paste becomes difficult to be squeezed out due to hardening by evaporation of alcohol.)
4. Apply adhesive paste renewedly every 5th days. (Tear off adhesive residue from dentures with fingers little by little.) Even if the interval is less than 5 days, renew it in the case of weakened adhesive power.
5. When it is difficult to remove adhesive residue from dentures, soak the dentures in hot water (at about 40°C) and then tear off softened adhesive residue slowly from the end. If everything else fails, wipe the adhesive residue away using alcohol diluted 2-fold with water. Do not soak dentures directly in alcohol for cleaning because dentures can change in shape and get broken. Watch out for fire before using alcohol.
6. Do not remove adhesive residue forcefully by use of metal tools. (Dentures can be damaged.)
7. When atmosphere temperature is low (especially in winter, when adhesive paste is hard to be squeezed), warm up the top of a capped tube by soaking in hot water (at about 40°C) until adhesive paste becomes easy to be squeezed.
8. When atmosphere temperature is high (especially in summer, when adhesive paste sticks to fingers), cool down the top of a capped tube by soaking in cold water for 2 to 3 minutes until adhesive paste becomes easy to be handled.

......Precautions......
1. Do not use this product continuously for a long time. (It may lead to gum recession or worsening of dental bite.)
2. If symptoms such as rash, redness, itching and swelling occur during or after use this product, stop using this product right away and ask your doctor, dentist, or pharmacist showing this document.
3. For stabilization of poor-fitting dentures caused by gum recession, limit this product to temporary use and ask your dentist for adjustment of the dentures as soon as possible.
4. Even if this product is applied to severely poor-fitting dentures, it will not provide sufficient stabilization.
5. If dentures are still not stabilized by use of this product, ask your dentist.

......Precautions for storage and handling......
1. Keep this product out of reach of children.
2. Avoid fire and direct sunlight and store in a cool place with a cap closed tightly.
